

PROJECT UPDATE

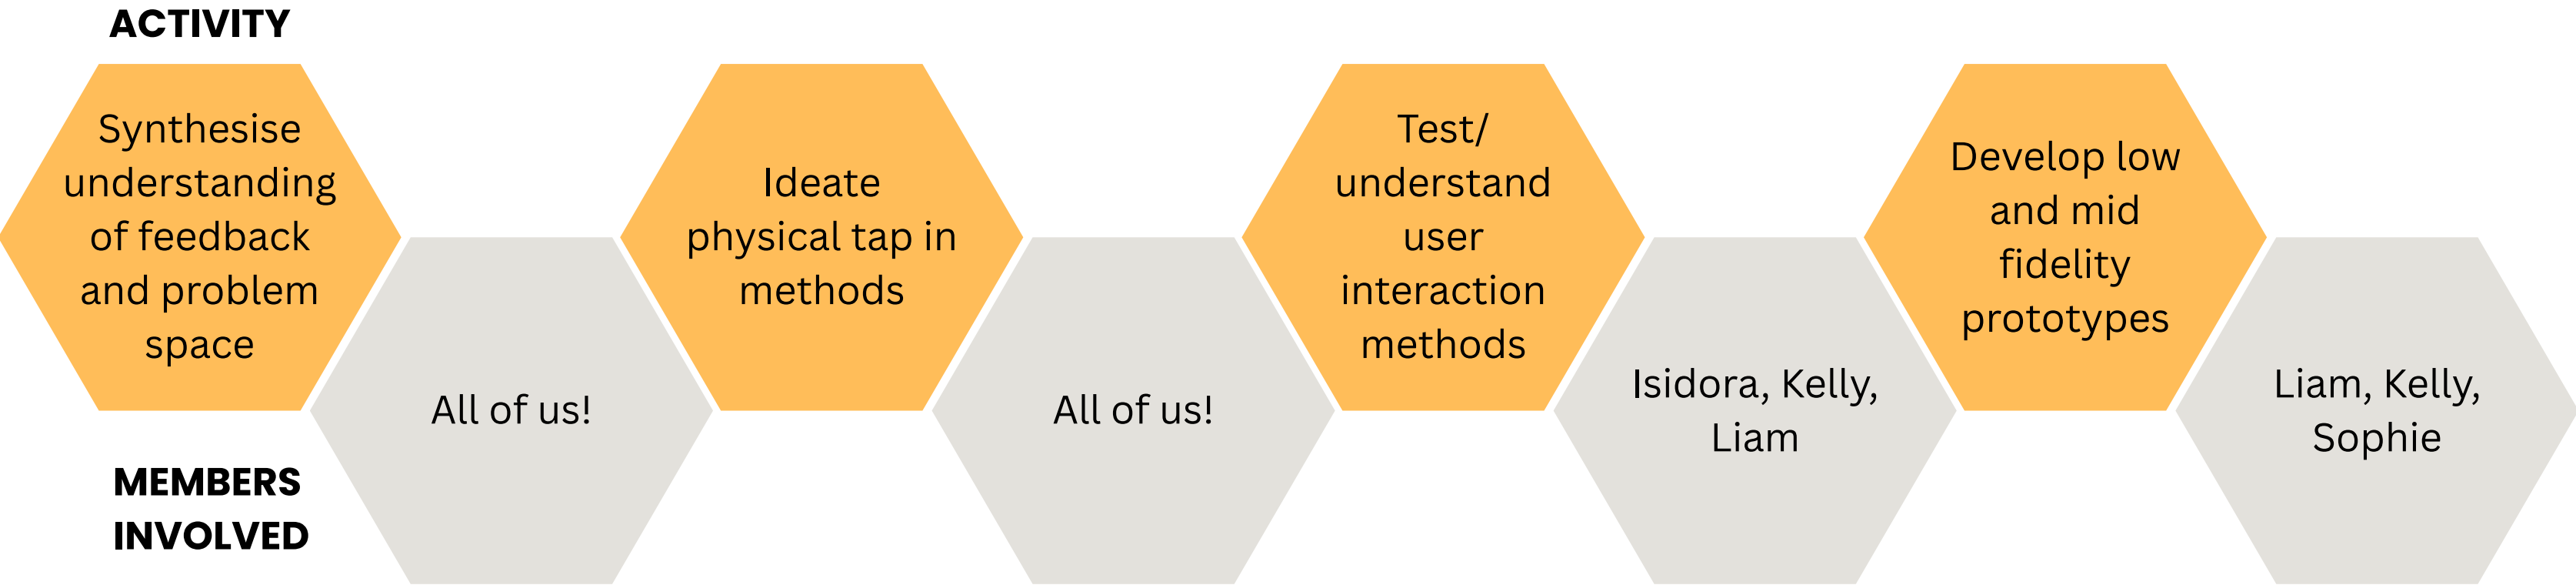

Team Zook!

DECO3500

OUR PROCESS

And what we all did!

RESEARCH FINDINGS

Goal of 2nd round of research: Discover and investigate how **existing groups interact and work together**, and how they use **provided resources to tackle a task**

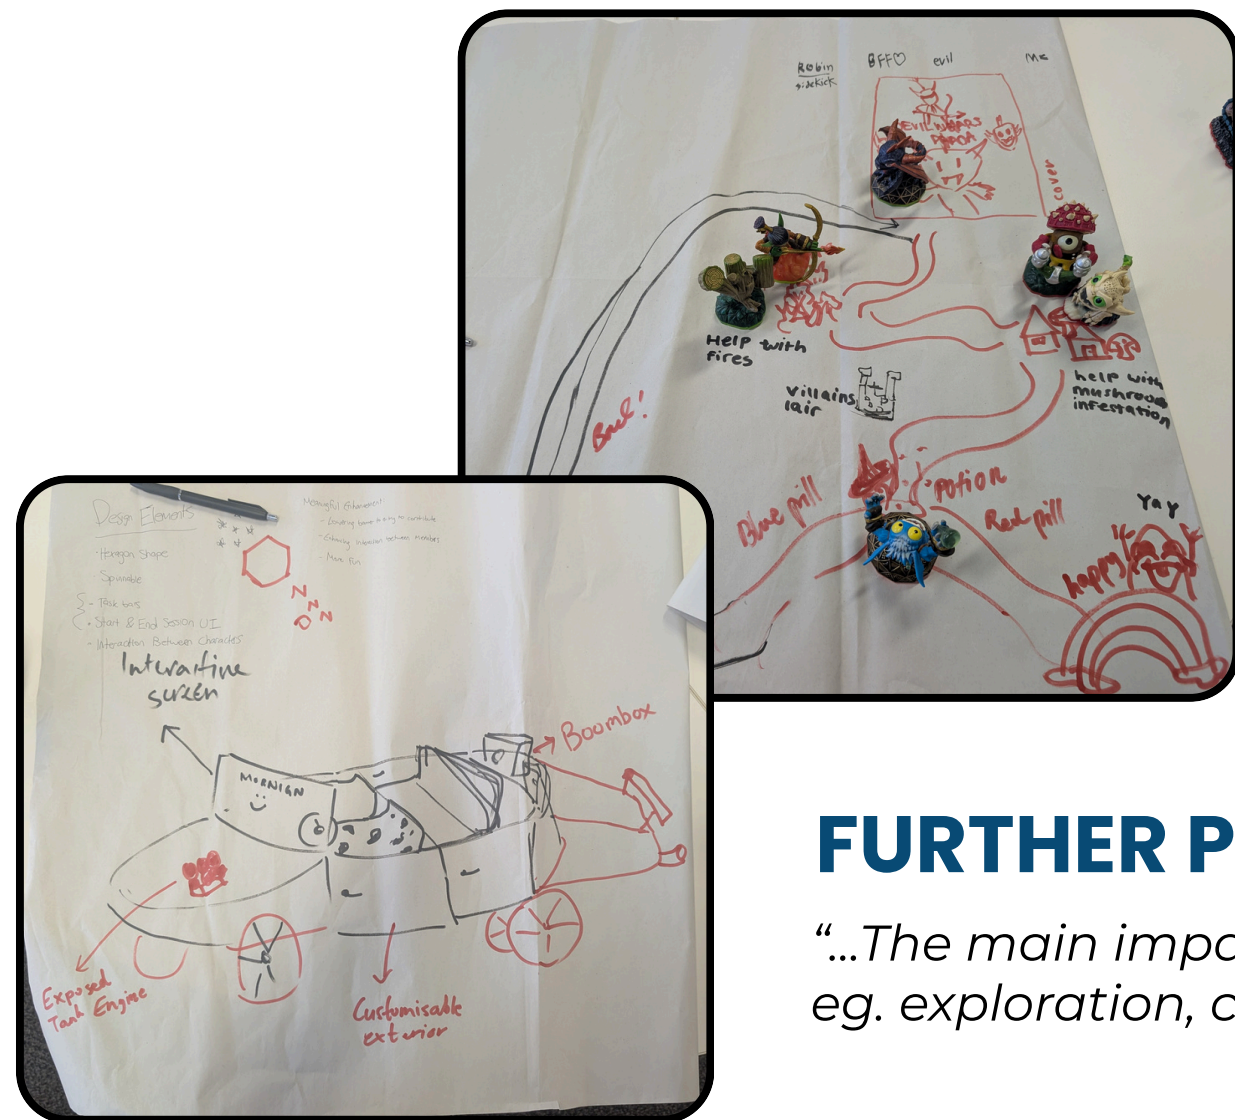

Testers use these physical objects as a method of **storytelling and embodiment!**

Varying results when making “using” these figures a **requirement** vs them being a **part of the process**-embodied interaction.

All users had to “**pull, move and rotate**” the butchers paper frequently and fluidly to share space- how can we **emulate this with a stationary surface?**

FURTHER PAPERS TO SUPPORT FINDINGS

“...The main impact of tangible interfaces is to promote constructive behavior, eg. exploration, collaboration, and playfulness of the task (B Schneider, 2011)”

User testing results

EXPERIENCE REQUIREMENTS

What did we learn (and what stayed the same)?

EXISTING REQUIREMENTS

Reduce friction between physical and online work

Center attention on **one main workspace** whilst protecting individual work

Lower barrier of entry to contribution

Provide same degree of freedom with a digital space*

NEW ADDITIONS

Lean heavily into **playfulness** and **storytelling**- how can we use social dynamics to enhance the collaboration experience?

Mini **interactions** between **figures** prompt **reciprocal** action from users

Coordination:

Combining actions

Framing: small in-person groups

Information Symmetry:

symmetrical on shared workspace but maintains individual work

Distribution:

shared

Event triggers: placing, drawing, proximity

Social

Technological

Mobile Experiences for Collocated Interaction

Spatial

Temporal

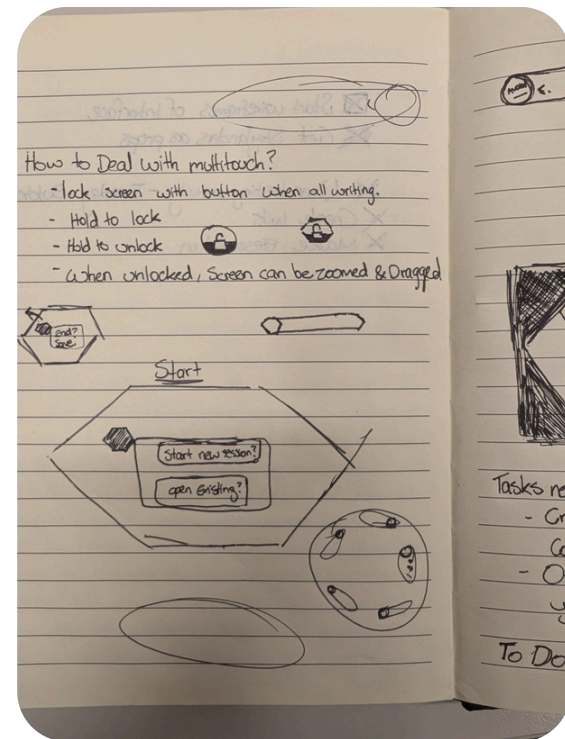

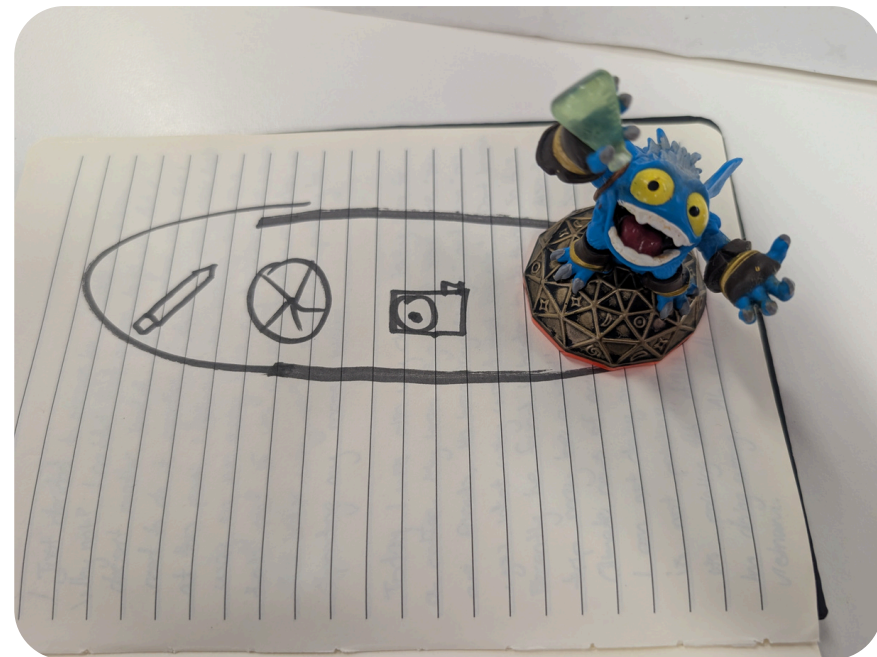

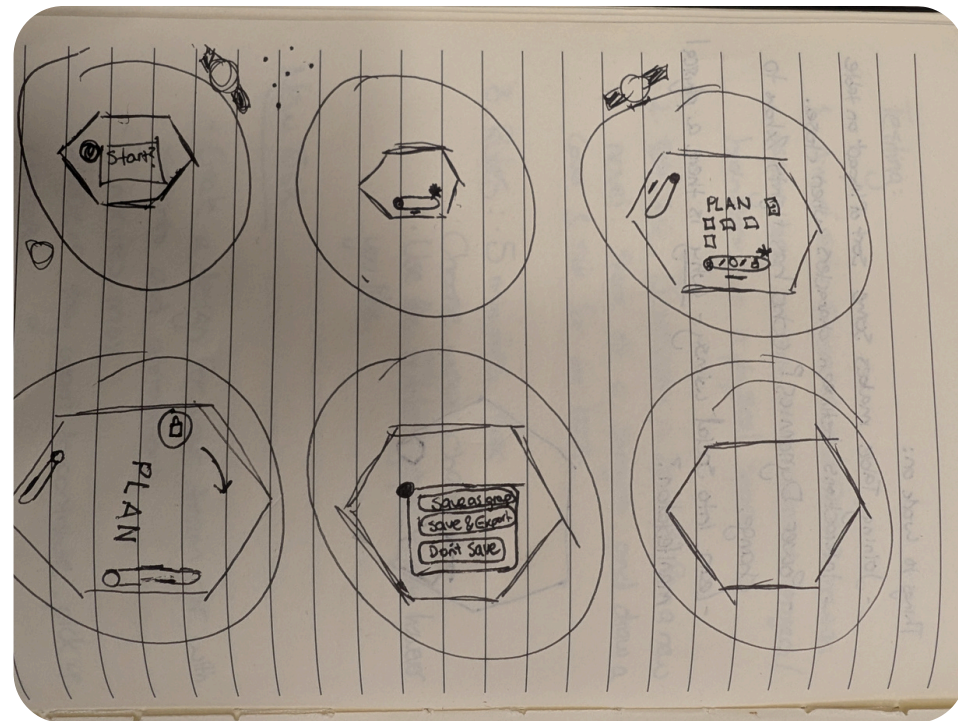

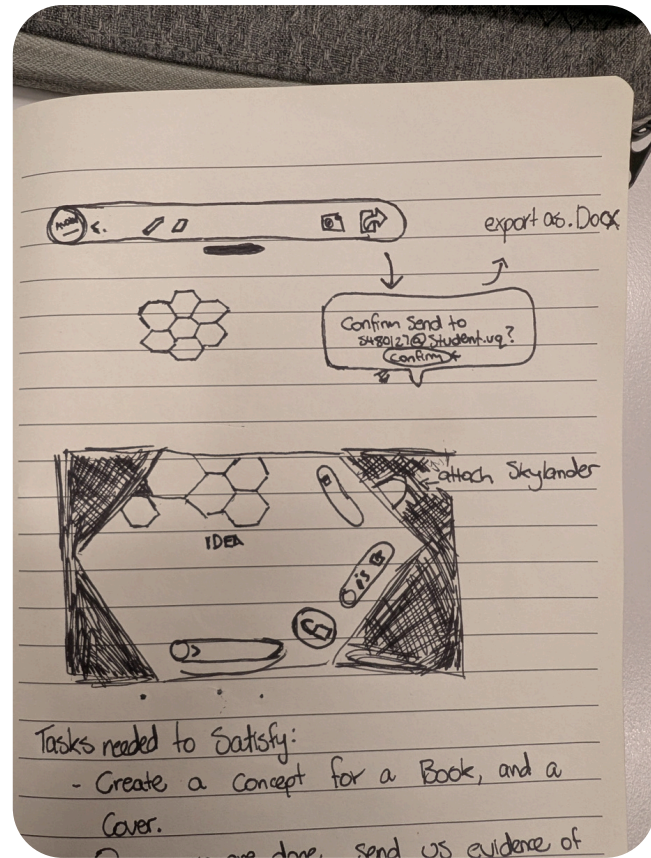

Proximity: people and objects

location: one sedentary location

Synchronisation: user driven

Engagement: continuous during a session, user and class paced

Early Sketches and wireframes

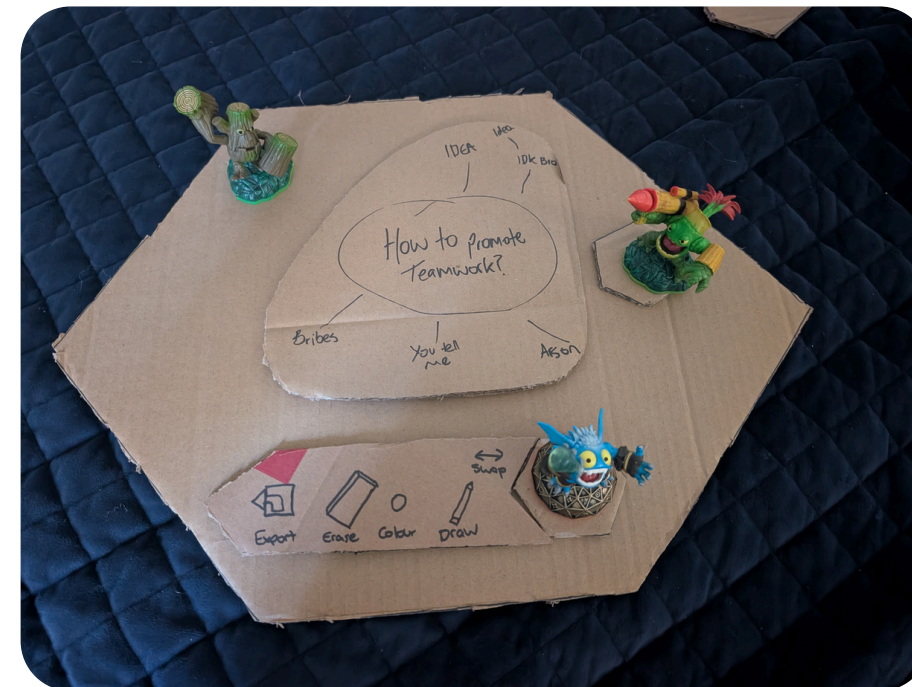

Which leads us to...

Which leads us to...

EARLY PROTOTYPING

Cardboard Prototype

WHAT'S NEXT?

Functional Prototype
Development

1

Develop **barebones functional prototype**-
Multi-touch sensors, figure detection and
page editing

2

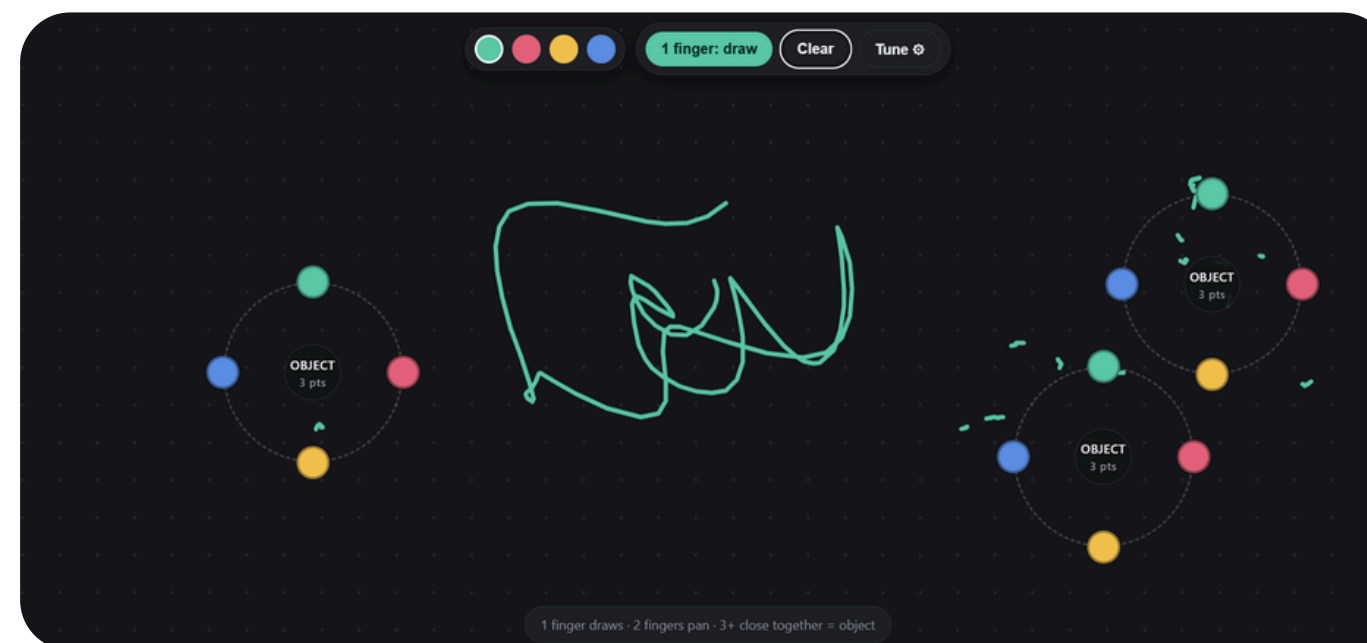

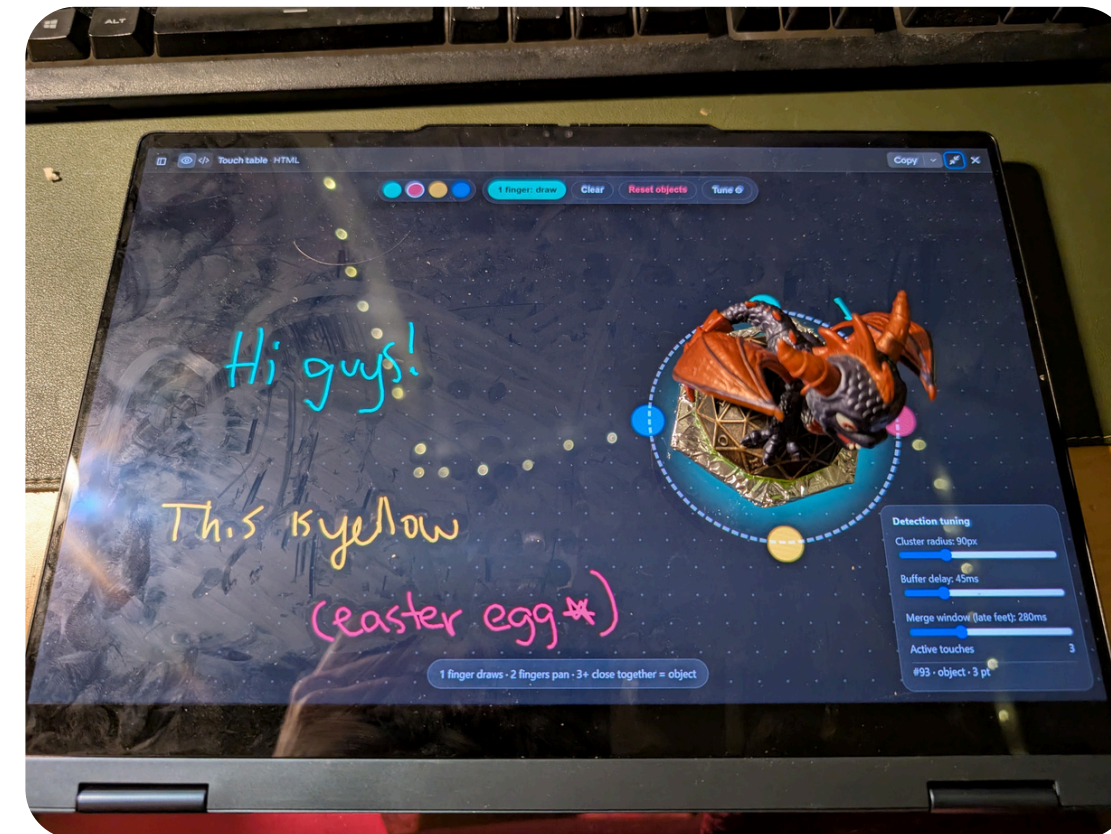

Test first version of prototype with **target
users** in a context specific environment

3

Create **final iteration** of prototype and
present!

What did we miss?

- A more strict following of our chosen framework
- Emphasis on user testing

FIN.
